

Do you have a MOTOTRBO application in service and are seeing excessive ARS data, perhaps causing busies on the voice channels?

Does your application have a high percentage of voice traffic which inhibits ARS registration data?

Announcing - *Enhanced Registration* - available now.

By combining the neoNytro Enterprise text messaging, GPS and Telemetry application and the Tallysman Sprite TW250 it is now possible to significantly reduce the data traffic on the voice channel. The subscriber radio can now register and deregister on the channel of your choosing.

Registration updates are now also handled by using Caller ID and GPS reports from subscriber radios, further reducing the requirement for registration updates.

Additional benefits from using this combination of products are ***Report Batching*** and ***Intelligent GPS Event Reporting***.

Some of the event types are:

- GPS with PTT
- Radio based Geofence reports
- Idle time
- Speeding reports
- Odometer

Make your new or existing MOTOTRBO applications more efficient and intelligent by calling NeoTerra Systems.

Demonstration packages available.
